AgResearch

Meat Industry Microbiological Methods

Edition 5
April 2011

Editor-in-chief:
John Mills

This manual has been written for the New Zealand meat industry and presents methods suitable for that industry.
Contributors

Food Assurance and Meat Quality Team – AgResearch

Chapter 2 was contributed by Lynne Forster

Acknowledgements

The following are thanked for their contribution to the production of this manual: Andrew Hudson and Sally Hassel for providing information on Campylobacter; Roger Cook as Editor of the 2nd edition; Roger Cook and MAF for helpful advice; the Meat Industry Standards Council for initial financial support and MAF for ongoing support.

Meat Industry Microbiological Methods

Table of Contents

Introductory Material
Amendments – Document control sheet
Introduction to Edition 5

Laboratory Safety, Quality Control, General Procedures
1 Safety in Microbiology Laboratories
2 Quality Control in Microbiology Laboratories
3 Qualitative and Quantitative Methods for Evaluating Hygiene
4 Air Sampling
5 Collection and Preparation of Samples
  5.1 Introduction
  5.2 Sampling Plans and Rationale
  5.3 Sample Collection
  5.4 Sampling Methods
  5.5 Sampling Plans for Meat and Meat Products
  5.6 Preparation of Samples
  5.7 Preparation of Dilutions
  5.8 Purification Techniques and Media
  5 Appendix 1 Important Points for Accurate Microbiological Analysis

Procedures for Meat and Meat Products
6 The Aerobic Plate Count
7 Methods for Detecting and Enumerating Pathogens in Meat and Meat Products
  7.1 Introduction
  7.2 Bacillus cereus
  7.3 Campylobacter
  7.4 Escherichia coli O157:H7
  7.5 Listeria monocytogenes
  7.6 Motile aeromonads
  7.7 Salmonella
  7.8 Staphylococcus aureus
  7.9 Streptococcus pyogenes
  7.10 Sulphite-Reducing Anaerobes
  7.11 Vibrio parahaemolyticus
  7.12 Yersinia enterocolitica
8 Enteric Indicator Organisms for Meat and Meat Processing

8.1 Introduction
8.2 Enterobacteriaceae
8.3 Enterococcus
8.4 Escherichia coli
8.5 Faecal coliforms

9 Spoilage Organisms on Chilled Meats

9.1 Introduction
9.2 Brochothrix thermosphacta
9.3 Differential Plate Count
9.4 Enterobacteriaceae
9.5 Fungi (moulds and yeasts)
9.6 Halophiles and Halotolerants
9.7 Lactic acid bacteria
9.8 Pseudomonas

Procedures for Potable and Natural Waters and Effluents

10 Techniques for Enumerating Bacteria in Water

11 Testing Potable Water for Indicator Bacteria

11.1 General Information
11.2 Diluent and Rinsing Buffer
11.3 Membrane Filter Method for Total Coliforms
11.4 Membrane Filter Method for Faecal Coliforms
11.5 Identification of Coliform Species, Including E. coli
11.6 Standard Plate Count – Pour Plate Method
11.7 Membrane Filter Method for Faecal Streptococci
11.8 MPN Method for Spores of Sulphite-reducing Clostridia
11.9 Membrane Filter Method for Enterococci
11 Appendix 1 Rapid Methods
11A1.1 Chromogenic Substrate Methods for Total Coliforms and E. coli
11 Appendix 2 Traditional MPN Method for Total Coliforms, Faecal Coliforms and E. coli
11 Appendix 3 Membrane Filter Method for Clostridium perfringens

12 Indicator Organisms in Natural Waters and Effluents

12.1 Introduction
12.2 Enterococci
12.3 Escherichia coli and Faecal Coliforms
12.4 Defined Substrate Methods for Enterococci or Escherichia coli in Natural Waters 12.4-1

13 Pathogens in Natural Waters and Effluents

13.1 Thermophilic Campylobacters: MPN Method
13.2 Salmonella: MPN Method
13 Appendix 1 Thermotolerant Campylobacter in potable water
Microscope Methods and Biochemical Tests

14 Microscope Methods

15 Biochemical Tests

Appendices

16 Appendices

Appendix 1 Reference strains
Appendix 2 Requirements for export
Appendix 3 HACCP
